CS1515 - Cloud Computing

CO-1

1. Cloud computing:-

Cloud computing is the delivery of computing services such as servers, storage, database, networking and software over the internet on demand.

Cloud computing	on-premise computing
1. Resources are accessed over the internet.	1. Resources are maintained locally.
2. usually requires less initial investment.	2. Requires purchasing hardware & infrastructure.
3. Resources can scale quickly.	3. scaling often requires buying new hardware.
4. Provider manage much of the infrastructure.	4. organization manages its own infrastructure

2. Evolution of cloud computing:-

1. Main frames:- centralized computing.
2. Personal computer:- individual computing.
3. Client server:- sharing resources through networks.
4. Distribution computing:- Multiple computers work together.
5. Virtualization:- Multiple virtual machines on one server.
6. Internet evolution:- enabled internet access to applications.
7. Modern cloud:- provides scalable services over the network.

3. Virtualization:- Create multiple virtual machines on one physical server using a hypervisor.

Cloud Computing:- Delivers computing resource as services over the internet.

Difference:- Virtualization is a technology, while cloud computing is a service model.

4. Role of data centers:-

* Store data and applications.
* Provides computing power.
* Connects servers through networks.
* Protect data using security measures.
* Ensure availability through backup system.

5.

5. IaaS, PaaS, SaaS and XaaS

Model	Meaning	Example.
IaaS	– Infrastructure as a service	– Amazon EC_2
PaaS	– Platform as a service	– Google AppEngine
SaaS	– Software as a service	– Microsoft 365
XaaS	– Everything as a service.	– AWS services
